

WASTE TO WORTH: SUSTAINABLE UTILIZATION OF UNUSED CAMPUS ASSETS

PROBLEM

In our campus, a large amount of unused furniture and utensils is left to decay without any accountability or reuse planning. Functional wooden and metal items, including steel plates and glasses, are stacked away for years, becoming corroded or rotted. Every year, this waste grows resulting in tons of reusable materials being discarded. This not only reflects poor inventory management and resource wastage but also affects the college's cleanliness, aesthetics, and overall prestige, calling for urgent sustainable action.

STEPS THAT CAN BE TAKEN

One possible solution to this issue could be avoiding the disposal of items that are still reusable, as throwing them away only adds to pollution and resource waste. Maybe slightly damaged wood could be used for fillers or small projects, and corroded metal might be restored or repurposed. For items beyond use, selling them to scrap dealers could help. The earnings might even support the workers cleaning the area and free up valuable space.
